Science Practices Continuum - Students' Performance

This continuum is intended for teachers and administrators to use in guiding and evaluating student performance in the science practices. The levels reflect increasingly sophisticated engagement in the practices and are not grade-level specific; K-8 students can engage in the practices in developmentally appropriate ways at any of these levels. Appendix F in the NGSS provides significantly more detail for each practice (that should be integrated as both students and teachers develop greater fluency with each practice). The practices are grouped into the "Investigating" "Sensemaking" and "Critiquing" practices.

		Level 1	Level 2	Level 3	Level 4
ices	1. Asking questions	Students do not ask questions.	Students ask questions, but they are not typically scientific questions (i.e., not answerable through the gathering of evidence or about the natural world).	Students ask questions. Students' questions are both <i>scientific</i> and <i>non-</i> <i>scientific</i> questions.	Students ask questions. Students' questions are typically scientific (i.e. answerable through gathering evidence about the natural world).
Investigating Practi	3. Planning and carrying out investigations	Students do not design or conduct investigations.	Students conduct investigations, but these opportunities are typically teacher-driven. Students do not make decisions about experimental variables or investigational methods (e.g. number of trials).	Students design or conduct investigations to gather data. Students make decisions about experimental variables, controls or investigational methods (e.g. number of trials).	Students design and conduct investigations to gather data. Students make decisions about experimental variables, controls and investigational methods (e.g. number of trials).
I	5. Using mathematics and computational thinking	Students do not use mathematical skills (i.e., measuring, estimating) or concepts (i.e., ratios).	Students use mathematical skills or concepts but these are not connected to answering a scientific question.	Students use mathematical skills or concepts to answer a scientific question.	Students make decisions about what mathematical skills or concepts to use. Students use mathematical skills or concepts to answer a scientific question.

Sensemaking Practices	4. Analyzing and interpreting data	Students may record data, but do not analyze data.	Students work with data to organize or group the data in a table or graph. However, students do not recognize patterns or relationships in the natural world.	Students work with data to organize or group the data in a table or graph. Students make sense of data by recognizing patterns or relationships in the natural world.	Students make decisions about how to analyze data (e.g. table or graph) and work with the data to create the representation. Students make sense of data by recognizing patterns or relationships in the natural world.
	6. Constructing explanations	Students do not create scientific explanations.	Students attempt to create scientific explanations but students' explanations are descriptive instead of explaining how or why a phenomenon occurs. Students do not use appropriate evidence to support their explanations.	Students construct explanations that focus on explaining how or why a phenomenon occurs. Students do not use appropriate evidence to support their explanations.	Students construct explanations that focus on explaining how or why a phenomenon occurs and use appropriate evidence to support their explanations.
	2. Developing and using models	Students do not create models.	Students create models. Students' models focus on describing natural phenomena rather than predicting or explaining the natural world. Students do not evaluate the merits and limitations of the model.	Students create models focused on <i>predicting or explaining</i> the natural world. Students <i>do not evaluate</i> the merits and limitations of the model.	Students create models focused on <i>predicting or explaining</i> the natural world. Students <i>do evaluate</i> the merits and limitations of the model.

Critiquing Practices	7. Engaging in argument from evidence	Students do not engage in argumentation.	Students engage in argumentation where they support their claims with evidence or reasoning, but the discourse is primarily teacher-driven.	Students to engage in student-driven argumentation. The student discourse includes evidence and reasoning to support their claim. Students also agree and disagree, but rarely engage in critique.	Students engage in student-driven argumentation. The student discourse includes evidence, reasoning that links the evidence to their claim and critique of competing arguments during which students build on and question each other's ideas.		
	8. Obtaining, evaluating, and communicating information	Students do not read text for scientific information.	Students read text to <i>obtain</i> scientific information, but do <i>not evaluate</i> this information. Students also do <i>not</i> compare or combine information from multiple texts considering the strengths of the information and sources.	Students read and evaluate text to obtain scientific information. Students do not compare or combine information from multiple texts considering the strengths of the information and sources.	Students read and evaluate text to obtain scientific information. Students compare and combine information from multiple texts considering the strengths of the information and sources.
